ATCHISON, WILLIAM

County Pronounced: San Juan
Law Enforcement:
Agent: NMSP Agent R. Matthews
Date of Birth: 3/18/1996
Pronounced Date/Time: 12/7/2017 4:25:00 PM

Central Office Investigator: Rhonda Moya Deputy Field Investigator: Rhonda Moya

### **CAUSE OF DEATH**

Intraoral gunshot wound of head

**MANNER OF DEATH** 

Suicide

Mark Giffen, DO

Pathology Resident

## Lauren E Dvorscak, MD

Medical Investigator, Assistant Professor of Pathology

All signatures authenticated electronically

Date: 2/2/2018 4:21:41 PM

Printed: 2/19/2018 11:48:53 AM Report Name: Death Investigation Reporting Tool

### **DECLARATION**

The death of ATCHISON, WILLIAM was investigated by the Office of the Medical Investigator under the statutory authority of the Office of the Medical Investigator.

I, Lauren E Dvorscak, MD, a board certified anatomic, clinical, and forensic pathologist licensed to practice pathology in the State of New Mexico, do declare that I personally performed or supervised the tasks described within this Death Investigation Summary document. It is only after careful consideration of all data available to me at the time that this report was finalized that I attest to the diagnoses and opinions stated herein.

Numerous photographs were obtained along the course of the examination. I have personally reviewed those photographs and attest that they are representative of findings reported in this document.

This document is divided into 8 sections with a final Procedural Notes section:

- 1. Summary and Opinion
- 2. External Examination
- 3. Medical Intervention
- 4. Postmortem Changes
- 5. Evidence of Injuries
- 6. Internal Examination
- 7. Microscopy
- 8. Postmortem Computed Tomography

Should you have questions after review of this material, please feel free to contact me at the Office of the Medical Investigator (Albuquerque, New Mexico) - 505-272-3053.

Case Number: 2017-06753 Summary Opinion ATCHISON, WILLIAM

**Medical Investigator** 

**Medical Investigator Trainee** 

Lauren E Dvorscak, MD Mark Giffen, DO

### SUMMARY AND OPINION

#### PATHOLOGIC DIAGNOSES:

- I. Perforating, intraoral gunshot wound of the head, contact range
  - A. Path: palate, basilar skull, pituitary, brain, skull, scalp
  - B. Trajectory: front to back, upward
  - C. Associated injuries:
    - 1. Periorbital ecchymosis
    - 2. Avulsion, incisors
    - 3. Mucosal lacerations, lips and gingivae
    - 4. Subscalpular and subgaleal hemorrhage
    - 5. Fractures, facial, calvarial, and basilar skull
    - 6. Subarachnoid hemorrhages
    - 7. Intraparenchymal and cortical contusions, temporal lobes and basal ganglia
    - 8. Intraventricular hemorrhage
    - 9. Pneumocephalus, by computed tomography
- II. Blunt trauma
- A. Contusions, abrasions, and lacerations, hands
- B. Contusion, posterior thigh
- III. Hepatic steatosis, mild
- IV. Simple cyst, left renal cortex

#### SUMMARY AND OPINION:

This 21-year-old man, William Atchison, died of an intra-oral gunshot wound of the head.

According to investigative reports, Mr. Atchison entered a high school in Aztec, New Mexico on 12/7/2017 in the morning. He reportedly fired a handgun and shot two students (OMI# 2017-06754 and OMI# 2017-06755), prior to taking his own life.

Autopsy revealed a single, contact-range, intraoral gunshot wound of the head with lethal injuries of the skull and brain. Numerous skull and facial fractures were associated with air in the cranial vault, as well as bleeding around and within the brain. A projectile was not retained. Additional injuries included bruises, skin scrapes and small skin tears on the knuckles of the hands, as well as a bruise on the thigh. Faint ink markings were on the skin of the lower extremities.

Evidence of natural disease included mild fatty changes in the liver and a non-cancerous cyst in the left kidney.

Toxicology analysis of the postmortem femoral blood and urine was negative for alcohol and common drugs of abuse.

Mr. Atchison died as the result of a self-inflicted, intraoral gunshot wound of the head. The manner of death is suicide.

Case Number: 2017-06753 External Examination ATCHISON, WILLIAM

**Medical Investigator** 

**Medical Investigator Trainee** 

Lauren E Dvorscak, MD Mark Giffen, DO

**External exam date time:** 12/8/2017 8:51:00 AM

Cosmetic piercing present:		No	No	
			Scar(s)	
Scar(s) present:		Yes		
Scar right lower le	eg:	Yes		

#### External exam comment:

Faint ink markings and a symbol are on the skin, generally oriented upside-down, as follows:

- 1. On the left, upper thigh are markings that appear as "SS", "AMOG" and a swastika symbol.
- 2. Above the left knee is a marking that appears as "BUILD WALL".
- 3. In the right groin is a marking that appears as "your home".

A trace hair is collected from the left hand and packaged as evidence.

Are there any injuries:

Yes

Evidence of Injury:		
Autopsy date:	12/8/2017 8:51:00 AM	

#	Injury	Location	Injury Description
1	Firearm injury	Head	GUNSHOT WOUND OF HEAD, INTRAORAL
			Entrance:
			On the left side of the hard palate, approximately 14.5 cm inferior to the top of the head and 1 cm left of anterior midline is an entrance gunshot wound consisting of a 2 x 1.8 cm, irregular defect. When viewed from below, a circumferential mucosal abrasion measures up to 0.3 cm in width at 6 o'clock. Soot is within the mouth, visible at the wound edges and within the wound track. No stippling is visible surrounding the entrance wound.
			Path:
			The hemorrhagic wound track sequentially perforates the left side of the hard palate, basilar skull, anterior sella turcica, pituitary gland, dura, left optic nerve, left basal ganglia, anterior corpus callosum, left medial parietal lobe, dura, left parietal skull near the vertex, and left parietal scalp. A projectile is not retained.
			Associated injuries:
			Blue-purple, periorbital ecchymosis is most prominent on the upper eyelids, measuring up to 4.5 x 3 cm on the right and 3 x 2.5 cm on the left. Blood is within the right external ear canal.
			The maxillary incisors demonstrate variable avulsion from the tooth sockets. The upper and lower lips are lacerated, with extension to the gingival surfaces. The hard palate has a midline fracture. Bloody fluid is within the upper and lower airways.
			Reflection of the scalp reveals patchy subscalpular hemorrhage. Focal subgaleal hemorrhage is at the posterior parieto-occipital skull, predominantly on the right side.
			Numerous calvarial and basilar skull fractures are present. Skull fractures also involve the bilateral orbits, the crista galli, and bilateral sphenoid wings. The exit wound in the calvarium is associated with external beveling of the outer skull table. The sella turcica and pituitary gland are disrupted. The anterior basilar circulation is disrupted; however the remainder of the Circle of Willis is overall intact.
			Patchy subarachnoid hemorrhages are present, involving the

Mark Giffen, DO

#### Microscopic description:

The hepatocytes are arranged into plates 1-2 cell layers thick with patchy areas of mild, mixed macro- and microvesicular steatosis. The portal tracts contain an appropriate number of bile ducts and blood vessels without significant fibrosis and rare chronic inflammation. The central veins are mildly dilated but patent without thrombosis.

The pancreas is autolyzed. No significant inflammation or fibrosis are present.

The left kidney does not demonstrate any significant glomerular sclerosis or interstitial inflammation. The tubules have mild autolytic change without inflammation, tubule drop out or fibrosis. No polarizable material is present.

The heart has no significant inflammation or fibrosis. The cardiac myocytes are unremarkable. The myocardial vessels are patent without significant medial hypertrophy or thrombosis.

The lungs have normal alveolar architecture with patchy areas of intra-alveolar erythrocytes. The interstitium adjacent to the bronchi and bronchioles demonstrates focal aggregates of pigment laden macrophages. No significant fibrosis or acute inflammation is present. No polarizable material is present.

The left parietal lobe contains foci of intraparenchymal hemorrhage and intra-dural, as well as subarachnoid hemorrhage comprised predominantly of intact erythrocytes. The left basal ganglia also has intraparenchymal hemorrhage. No gliosis, inflammation or hypoxic ischemic changes are present.

\*Unless otherwise indicated sections are stained only with hematoxylin and eosin (H&E).

Block	Tissue Location	Description	Stain
A1	Liver, Pancreas and Left kidney		
A2	Left ventricle, Upper lobe of left lung and Lower lobe of right lung		
A3	Left parietal lobe with subarachnoid hemorrhage	The state of the s	
A4	Left basal ganglia with contusion

 Accession number:
 2017-06753OMICT

**Exam type:** Postmortem full body computed tomography

Technique: Standard Comparison: None

Comments:

Evidence of perforating trauma includes a defect of the hard palate that extends through the skull base and sella turcica. Associated injuries include fractures of the hard palate and frontal bones, extending through the orbits, as well as fractures of the parietal bones.

A defect of the left, posterior parietal calvarium is associated with radiating fractures of the parietal and occipital bones.

Pneumocephalus is present. Scattered subarachnoid hemorrhages and intraventricular hemorrhage are present.

Dental restorations are detected.

A small, left renal cyst is present. No evidence of significant natural disease or additional significant injuries are detected by postmortem computed tomography scans.
